CyberGhost 7 for macOS

Unbreakable data protection for your Mac

Bucharest, October 18, 2018 – The CyberGhost VPN team launches a new macOS app (version 7.0), complete with Best Location, One-click Connect and Smart Rules for powerful, user-friendly privacy protection.

More than 20 million people from all over the world use CyberGhost VPN to become digitally invisible. Securing data as you move across the web and between devices is our specialty.

Today, we're excited to launch the new CyberGhost 7 for macOS. A complex, multi-layered infrastructure powers the simple, user friendly new app for your Mac.

We engineered the seventh generation of CyberGhost with one goal in mind: to make privacy accessible and hassle-free while giving you full control over your data protection, no matter the network you connect to.

Turn your Mac into the ultimate privacy device

Caring for your Apple devices means privacy and security are top priorities for you. That's why we worked hard to build CyberGhost 7 into the digital anonymity shield especially crafted for your Mac. We hope it meets (and hopefully exceeds) your expectations.

Here are **the new features** we hope you'll love about CyberGhost 7 for macOS:

- **One-click VPN connection** –encrypt your internet traffic on Wi-Fi or cable-based connections in just one click.
- **Smart Rules** – fully customize how CyberGhost works to protect your privacy by assigning specific triggers for different actions. Play with Wi-Fi Smart Rules and be on the lookout for more in future updates!
- **Best Location** – this useful feature connects you to the fastest server based on your location, so your requests are always handled in a jiffy.
- **Easier to use than ever** - you don't have to be a techie to master the new macOS app. The clean, simple design guarantees instant, effortless VPN protection.
- **Compact view and expanded view** – connect to your favorite servers or fire up a VPN connection with Best Location for almost instantaneous data security, or take your time to adjust your connection features for multi-layered privacy protection.
- **Streaming servers filter** –we placed borderless streaming at your fingertips. Use the filter to find servers that are specifically optimized for streaming content. You can do the same for securing your downloads, at excellent speeds.
- **Favorite servers, always handy** – keep specific servers and countries close, so you can connect to them faster than ever before.

The core features you know and love about CyberGhost VPN are here to stay. What's more, we keep fine tuning and developing them each day, so you can enjoy:

- **Fast servers all over the world** – choose from **3,000+ servers in 60+ countries** and switch your IP for an anonymous one each time. As always, CyberGhost comes with no bandwidth limit!
- **No logs kept. Ever.** - as our founder said earlier this year (see the video), we believe "the only way to secure data is not to store it". We've always stood by our no logs policy that gives each CyberGhost user complete anonymity while using the app.
- **More flexibility across devices** – you can now use CyberGhost for your Mac, iPhone, iPad, and Apple Watch. Just log into your CyberGhost account to keep your identity and data safe across your favorite macOS devices. Now you can **secure 7 devices simultaneously** based on one CyberGhost subscription.

The new CyberGhost VPN for macOS works on:

- MacBook
- MacBook Air
- MacBook Pro
- iMac
- iMac Pro
- Mac Pro
- Mac mini

Running:

- macOS Mojave (10.14)
- macOS High Sierra (10.13)
- macOS Sierra (10.12)

Naturally, we can't wait to get feedback and continue to improve CyberGhost VPN to suit your privacy needs. We're here to help you with the challenges of securing your data!
